Why do we feel the way we feel? How do our thoughts and emotions affect our health? Are our bodies and minds distinct from each other or do they function together as parts of an interconnected system? In her groundbreaking book Molecules of Emotion, Candace Pert provides startling and decisive answers to these and other challenging questions that scientists and philosophers have pondered for centuries. Her pioneering research on how the chemicals inside our bodies form a dynamic information network, linking mind and body, is not only provocative, it is revolutionary. By establishing the biomolecular basis for our emotions and explaining these new scientific developments in a clear and accessible way, Pert empowers us to understand ourselves, our feelings, and the connection between our minds and our bodies -- body-minds -- in ways we could never possibly have imagined before. This book clearly explains the biochemical and biophysical process by which the human mind can influence the human body. This book brings out the reality how the disorders and diseases of human body are generated from the human mind. This book is completely capable of exposing how the human emotions and thoughts can influence the human DNA and also explains how our positive and negative emotions affect the physiology of cells of our body differently. This book clearly reveals how the psychology of the human mind can directly affect the human physiology at macroscopic and microscopic levels in the human body. It also specifically rules out how environment can affect the mind and the cells of the human body. It gives a clear cut concept on the role of perception, beliefs, and emotions in determining the health and disease of the cell. And explains how the perception, beliefs, and emotions of an individual affect the functioning of the cells in his body. This books rules out the existence of consciousness that brings life into existence in the human body. It also exposes the role of heart in becoming the seat of emotions and also projects out the truth that how the human heart can generate the strongest electromagnetic fields that can influence the functioning of each and every cells of human body. It also explains how these fields can be used to heal physical diseases and disorders. This book also exposes how the human gut can control the brain and emotions. It also explains the role of gut in creating health. This book put forth the secrets of the two independent organs in the human body that can control the human brain and that can create a powerful health in the human body. This book also introduces the role of electromagnetic fields in the creation of human body and how this field works in functioning of human body at subatomic level. This book exposes the quantum mechanical interaction of molecules in the human body which can clearly explain how the consciousness and mind can influence the DNA molecules independent of time and space. This book also explains how carbohydrates, amino acids, vitamins, and other fats are essential for the generation of positive health by increasing the raw material for the manufacturing of mood elevating neurotransmitters, neuropeptides, and neurohormones in the brain.

Draws on original experiments as well as scientific research to explore a theory that the entire universe is connected by a vast energy field that can be manipulated for the betterment of the world using positive thought processes.

Why are we obsessed with the things we want only to be bored when we get them? Why is addiction perfectly logical to an addict? Why does love change so quickly from passion to indifference? Why are some people die-hard liberals and others hardcore conservatives? Why are we always hopeful for solutions even in the darkest times—and so good at figuring them out? The answer is found in a single chemical in your brain: dopamine. Dopamine ensured the survival of early man. Thousands of years later, it is the source of our most basic behaviors and cultural ideas—and progress itself. Dopamine is the chemical of desire that always asks for more—more stuff, more stimulation, and more surprises. In pursuit of these things, it is undeterred by emotion, fear, or morality. Dopamine is the source of our every urge, that little bit of biology that makes an ambitious business professional sacrifice everything in pursuit of success, or that drives a satisfied spouse to risk it all for the thrill of someone new. Simply put, it is why we seek and succeed; it is why we discover and prosper. Yet, at the same time, it's why we gamble and squander. From dopamine's point of view, it's not the having that matters. It's getting something—anything—that's new. From this understanding—the difference between possessing something versus anticipating it—we can understand in a revolutionary new way why we behave as we do in love, business, addiction, politics, religion—and we can even predict those behaviors in ourselves and others. In The Molecule of More: How a Single Chemical in Your Brain Drives Love, Sex, and Creativity—and will Determine the Fate of the Human Race, George Washington University professor and psychiatrist Daniel Z. Lieberman, MD, and Georgetown University lecturer Michael E. Long present a potentially life-changing proposal: Much of human life has an unconsidered component that explains an array of behaviors previously thought to be unrelated, including why winners cheat, why geniuses often suffer with mental illness, why nearly all diets fail, and why the brains of liberals and conservatives really are different.

The chief of neuroendocrine immunology at the National Institute of Mental Health offers evidence that emotional and physical health influence each other, and examines the critical role relationships, faith, and emotional well-being play in resisting dise
