It was felt that any trauma-specific quality of life measurement tool should be able to quantify post-traumatic stress disorder symptom severity accurately. The 111 subjects used to conduct the validity assessment were drawn consecutively from the 394 subjects and were similar demographically, ensuring minimal variability (Table I).

A psychiatric condition commonly associated with trauma exposure is posttraumatic stress disorder (PTSD) which includes a variety of symptoms:

- Re-experiencing the trauma in distressing ways
- Avoidance of trauma-related cues
- Negative beliefs about oneself or others as a result of trauma
- Mood alterations following the trauma
