Ocular Anatomy And Physiology passes from the back of the eye to the brain, leaves the orbit through the optic canal. The eye is supplied with nerves from different parts of the nervous system. Different nerves perform different functions in the body. Throughout this course, you will see reference to the following functional groups: • sensory nerves • motor nerves

Ocular Anatomy and Physiology With collaborations from Al Lens, Sheila Coyne Nemeth, and Janice K. Ledford, *Ocular Anatomy and Physiology, Second Edition* now begins with a jump-start chapter to overview the topic for those new to the field of eye care. Chapter two delves into embryology—a topic rarely covered—and addresses each structure of the eye, including the bony orbit, eyebrows, eye lids, lacrimal system, extraocular muscles, and the globe.

The orbit is the bony eye socket of the skull. The orbit is formed by the cheekbone, the forehead, the temple, and the side of the nose. The eye is cushioned within the orbit by pads of fat. In addition to the eyeball itself, the orbit contains the muscles that move the eye, blood vessels, and nerves.

Anatomy and physiology of the eye Our eyes allow us to visualize the world around us. They do this by converting light waves into neural signals so that our brains can process them. The eye itself is shaped like a sphere that is elongated horizontally, as opposed to being perfectly round, and only the anterior one-sixth of the eye is visible.
