Coarse-grained reconfigurable architectures (CGRAs) offer performance and energy efficiency close to those of ASICs and a programmability level closer to application software, offering a good trade-off between NRE and device cost. However, CGRAs have not yet been widely adopted because of a lack of mature architectures and programming tools.

Abstract: Reconfigurable architectures can bring unique capabilities to computational tasks. They offer the performance and energy efficiency of hardware with the flexibility of software. In some domains, they are the only way to achieve the required, real-time performance without fabricating custom integrated circuits.

Reconfigurable computing is a computer architecture combining some of the flexibility of software with the high performance of hardware by processing with very flexible high speed computing fabrics like field-programmable gate arrays. The principal difference when compared to using ordinary microprocessors is the ability to make substantial changes to the datapath itself in addition to the control flow. On the other hand, the main difference from custom hardware, i.e. application-specific integ

### Reconfigurable computing - Wikipedia

Although reconfigurable computing promises huge performance benefits for a wide range of different applications, there are many factors that have limited its effectiveness so far. Perhaps most concerning, current generation commercial FPGA architectures and design tools simply do not provide adequate support for these types of applications. In this talk we will discuss the details [...]
